VPN connection guide

Purpose and access

This is a fictional Northstar IT manual created for the DocuAssist portfolio project. It is not an HCLTech policy or a procedure for a real employer.

The Northstar VPN provides remote access to internal applications. Employees use their corporate account and the approved Northstar Connect client.

Only managed company devices may connect to the VPN. Personal devices are not supported by this demonstration policy.

For a connection problem, record the error code and open an IT support ticket. Never include passwords or MFA recovery codes in a ticket.

VPN connection guide

Prerequisites and connection steps

Before connecting, install the approved Northstar Connect client and enroll your corporate account in multi-factor authentication (MFA).

Use a trusted home or office network. Public shared Wi-Fi is not approved for VPN access in this fictional policy.

Open Northstar Connect, select the Corporate profile, sign in with your corporate account, approve the MFA request, and wait for the Connected indicator.

If MFA fails, stop the connection attempt and contact IT support with the error code. Do not disable MFA or share your credentials.

Disconnect the VPN when you finish your work session.
